

Using smartphones to understand cognitive development

Tobias U. Hauser

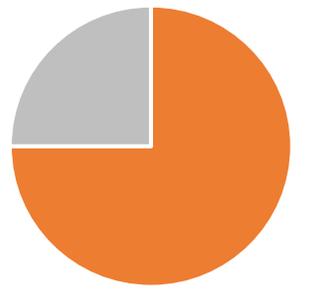

Department for Psychiatry & Psychotherapy, University of Tübingen

German Centre for Mental Health (DZPG)

Max Planck UCL Centre for Computational Psychiatry & Ageing Research

Wellcome Centre for Human Neuroimaging, UCL

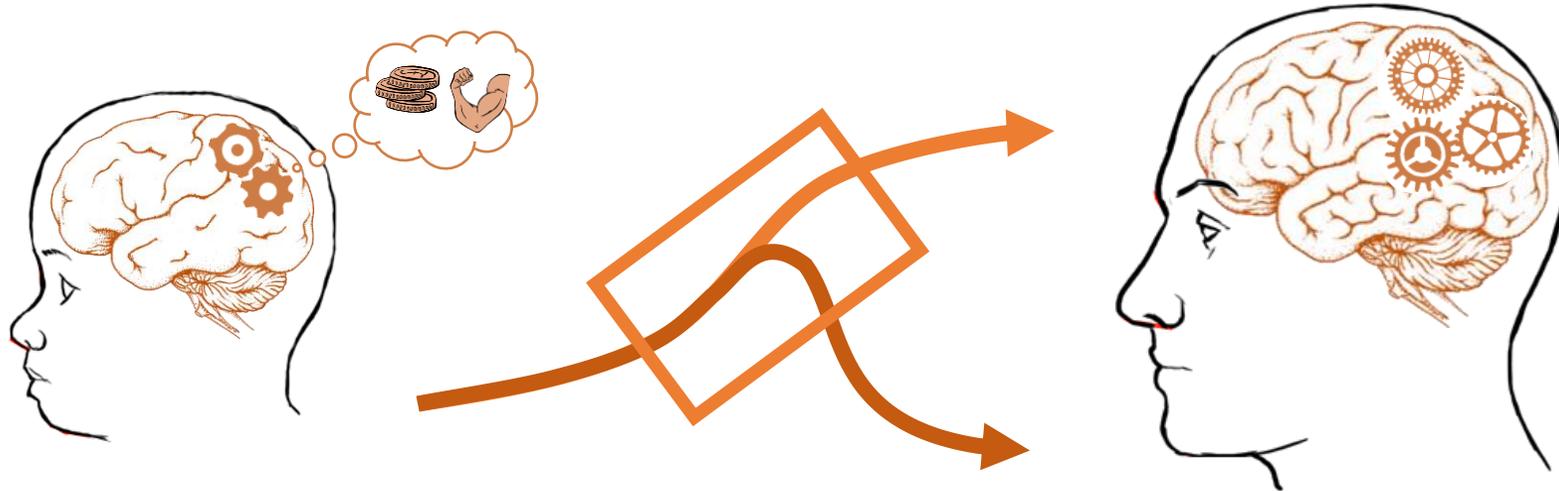

WHY IS DEVELOPMENT IMPORTANT?

75% psychiatric disorders begin before adulthood

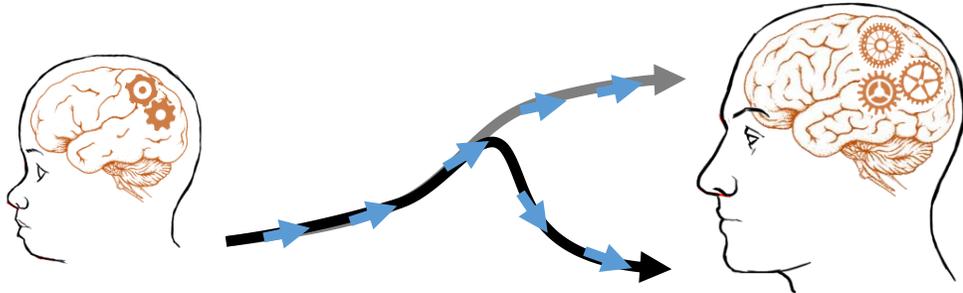

DEVELOPMENTAL COMPUTATIONAL PSYCHIATRY

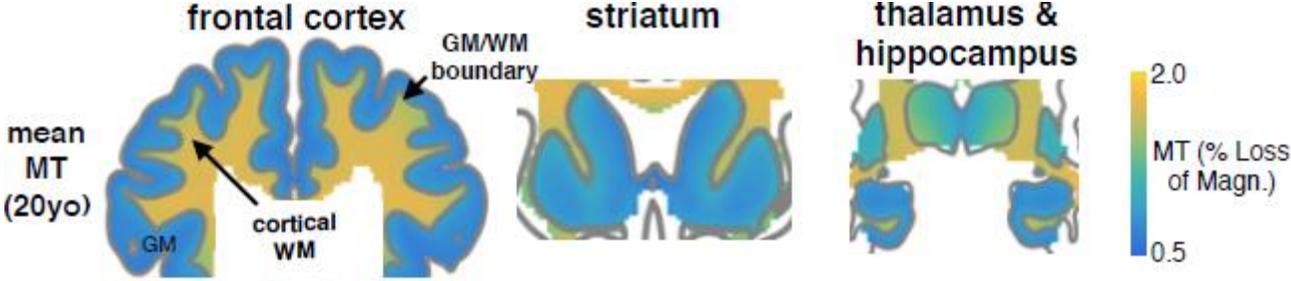

**hypothesis: cognitive and brain developments
contributes to emergence of mental illness**

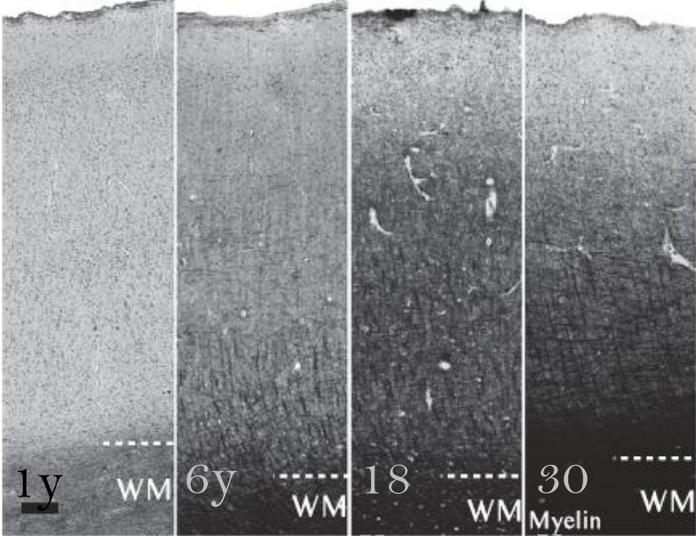

LINKING BRAIN DEVELOPMENT TO MENTAL HEALTH

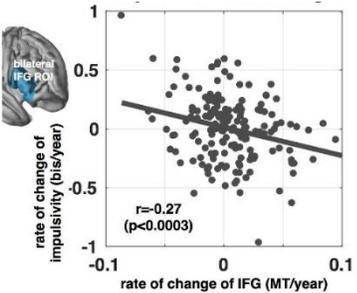

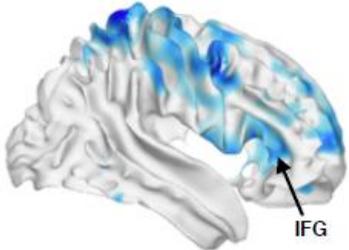

myelin-related (MT) brain development

myelination

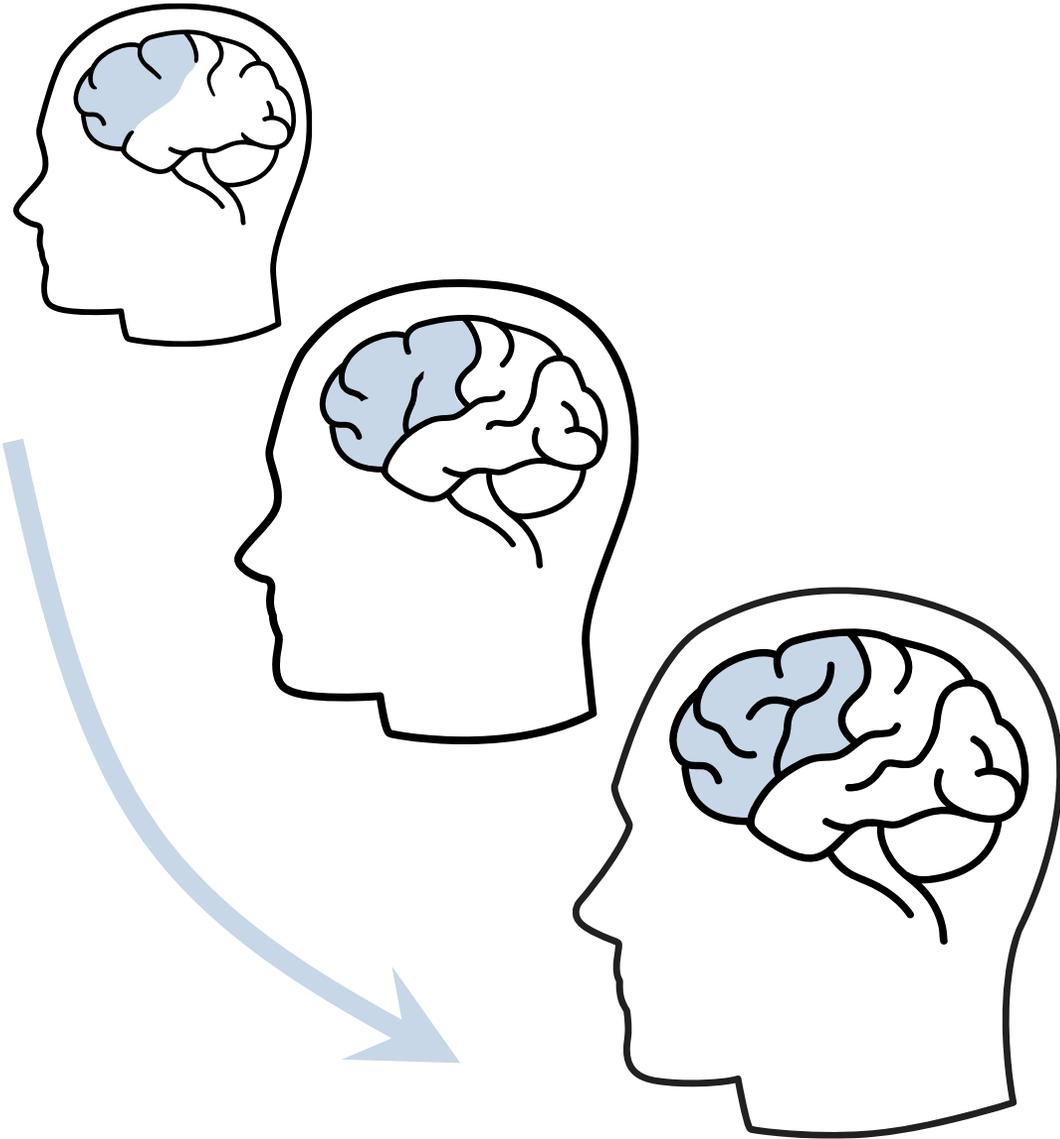

MT change linked to mental health

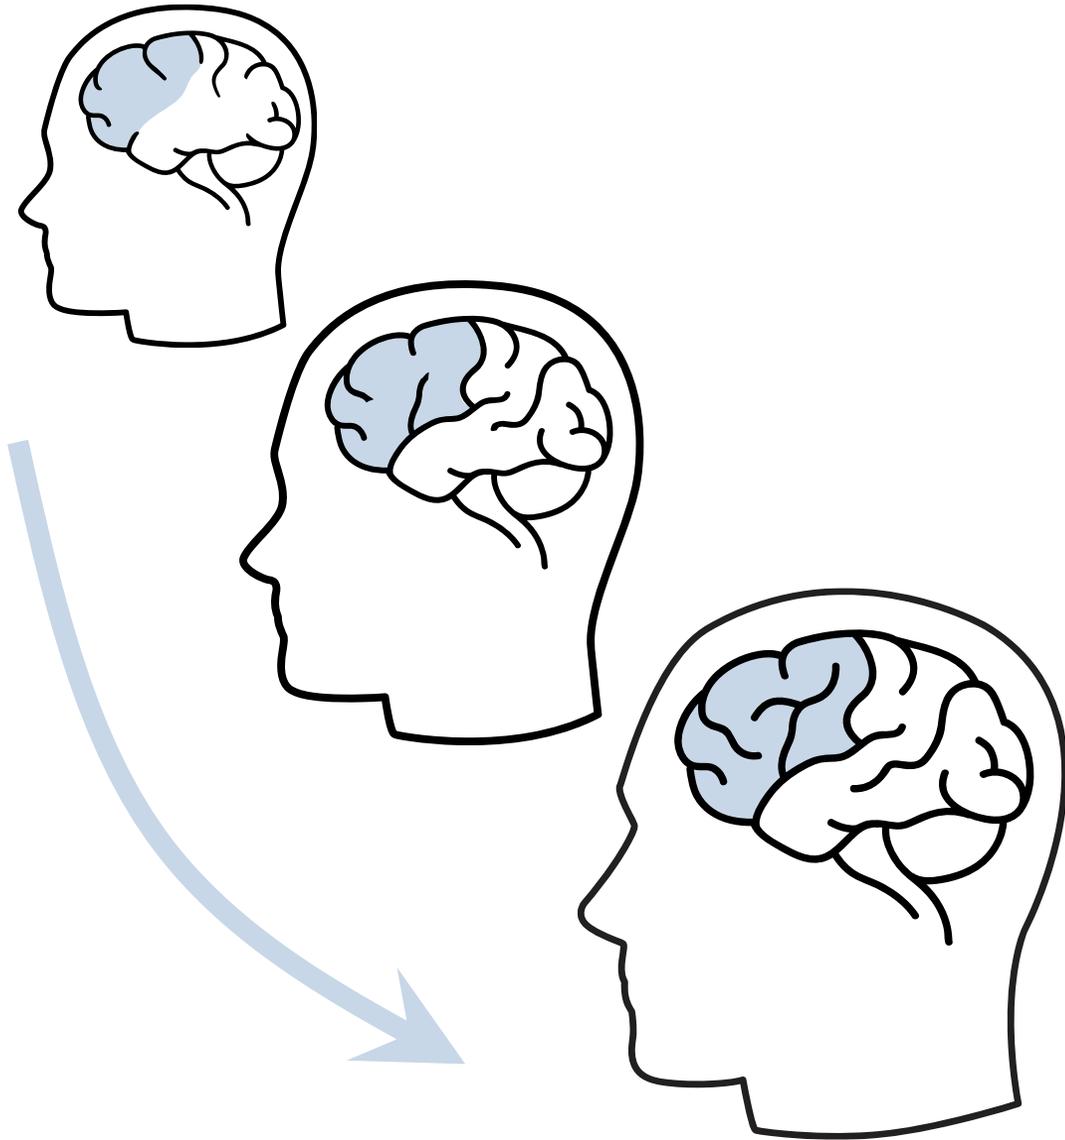

Ziegler*, Hauser* et al., 2019, *Nat Neuro*

THE PROBLEM

- **expensive**
- **highly selected samples**
- **few repeats**

COGNITIVE ONLINE ASSESSMENTS AS A PROXY

- **quick**
- **easy**
- **repeatable**

BRAIN EXPLORER APP

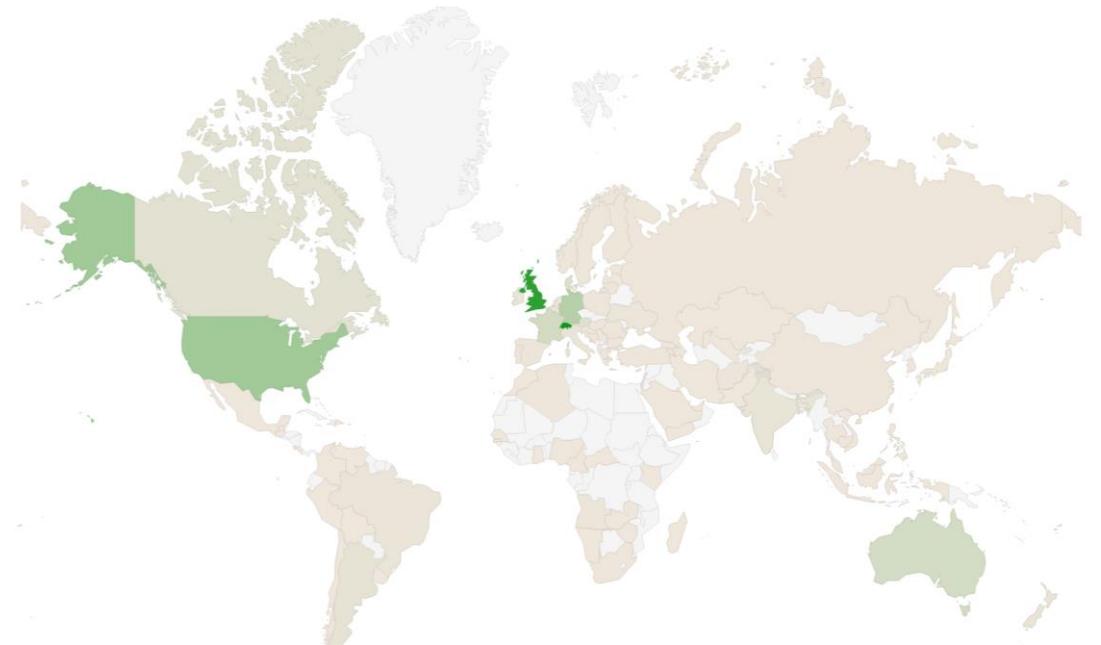

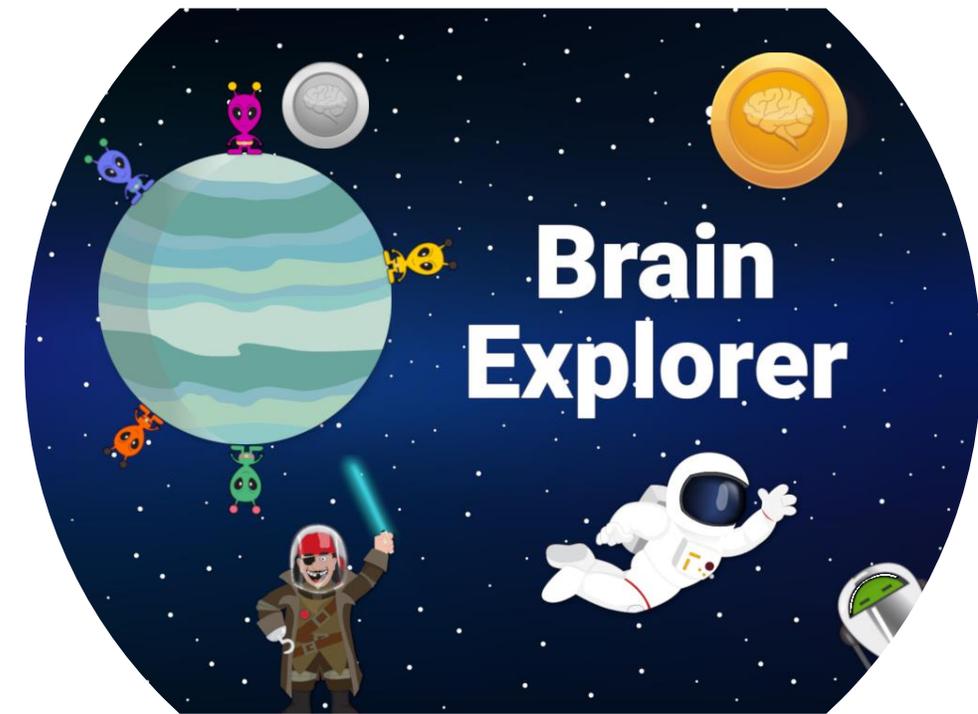

Brain Explorer

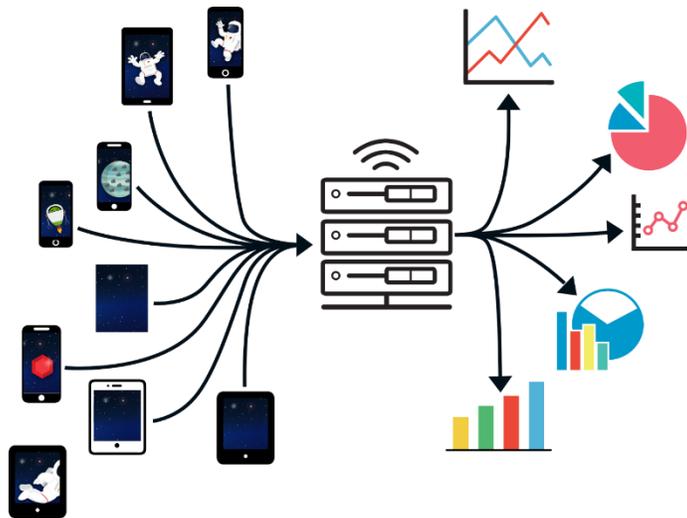

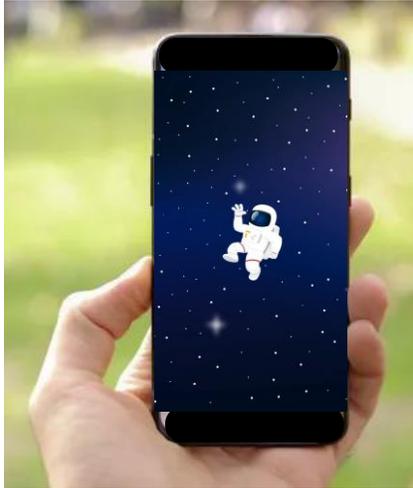

- App for Android & Apple
- multiple cognitive domains
- symptom questionnaires
- multi-lingual
- global
- >10,000 users

www.brainexplorer.net

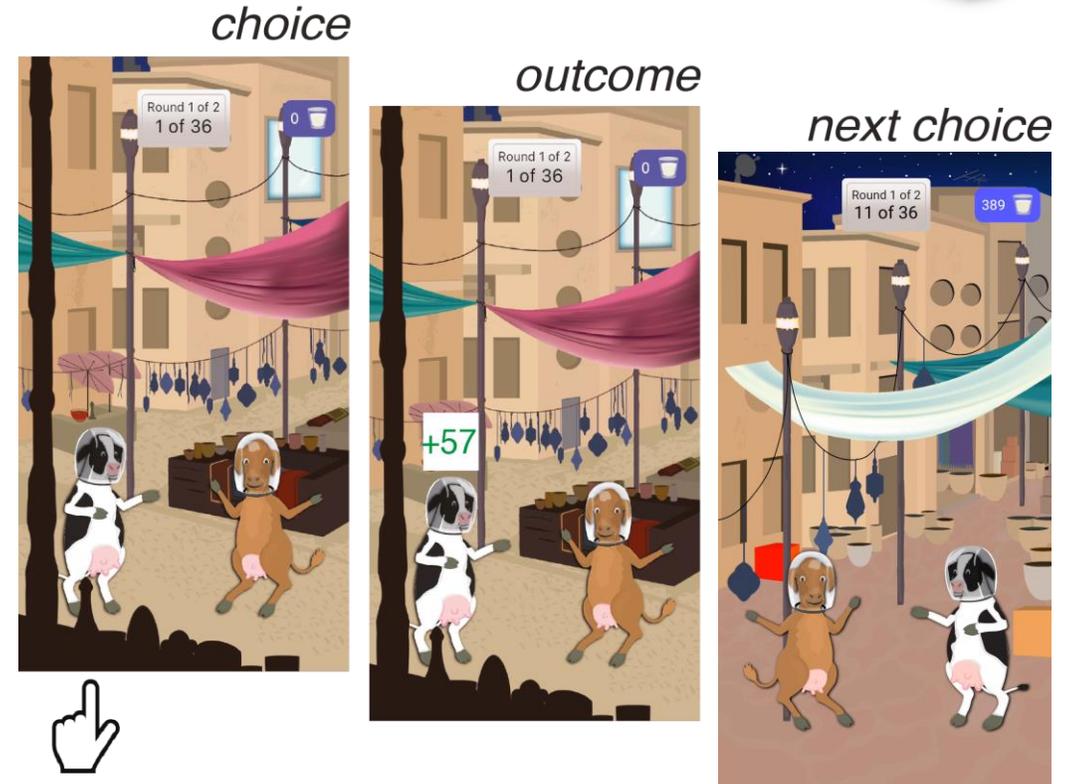

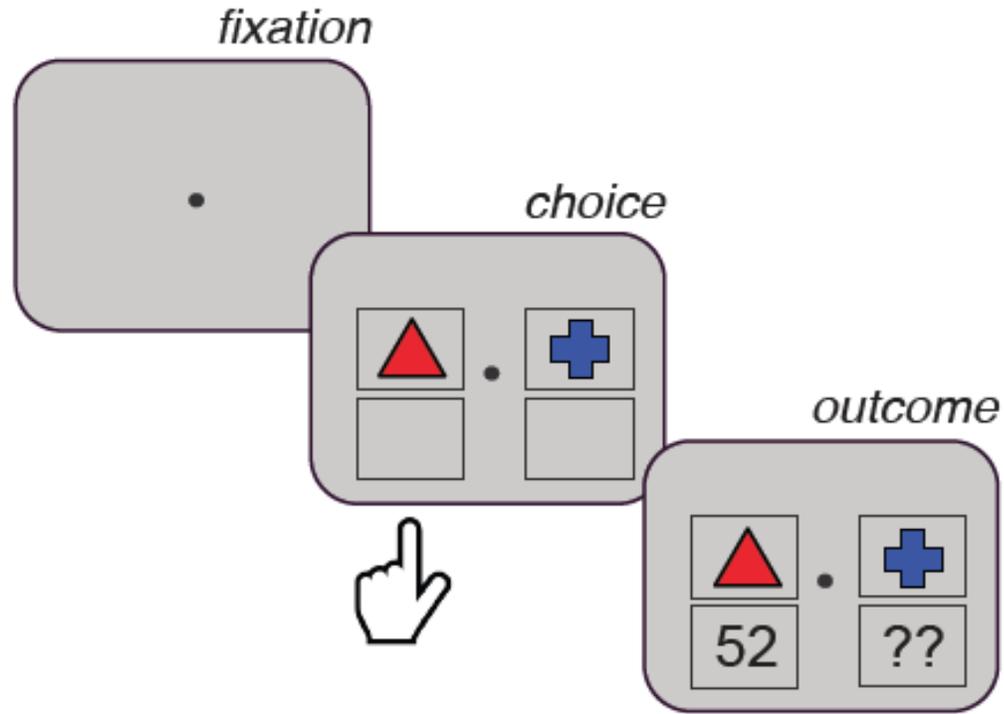

BRAIN EXPLORER APP

- incentive structure:
 - fun & entertainment
 - competition & self-evaluation
- much shorter games than in lab / paid online experiments
- minimal instructions, little “quality” control
- rewards (medals, ranks, awards)

FROM LAB TO PHONE: COGNITIVE FLEXIBILITY

COGNITIVE FLEXIBILITY ON THE PHONE

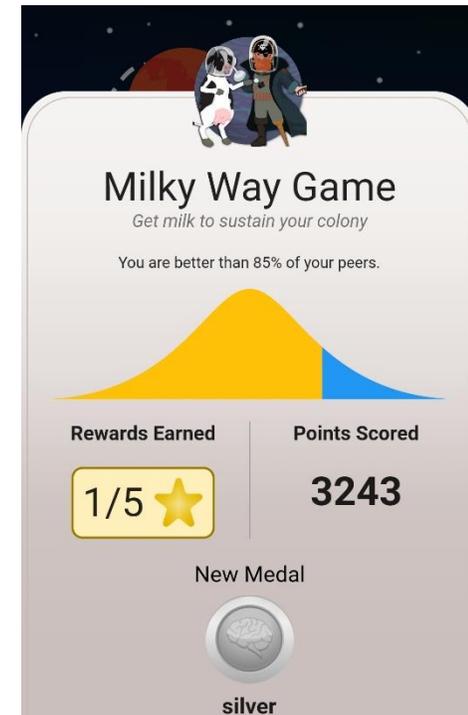

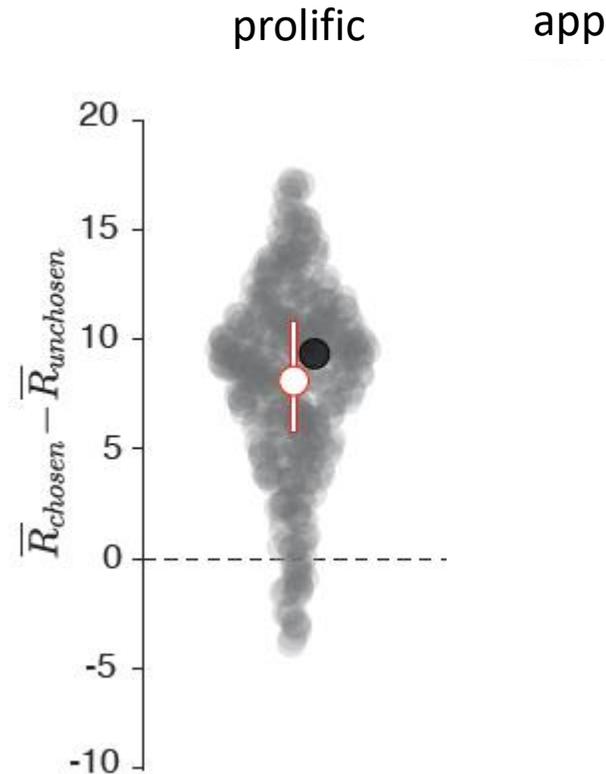

Prolific sample: N=392 (204F)

- detailed instructions & entry quiz
- 144 trials
- monetary incentive for performance

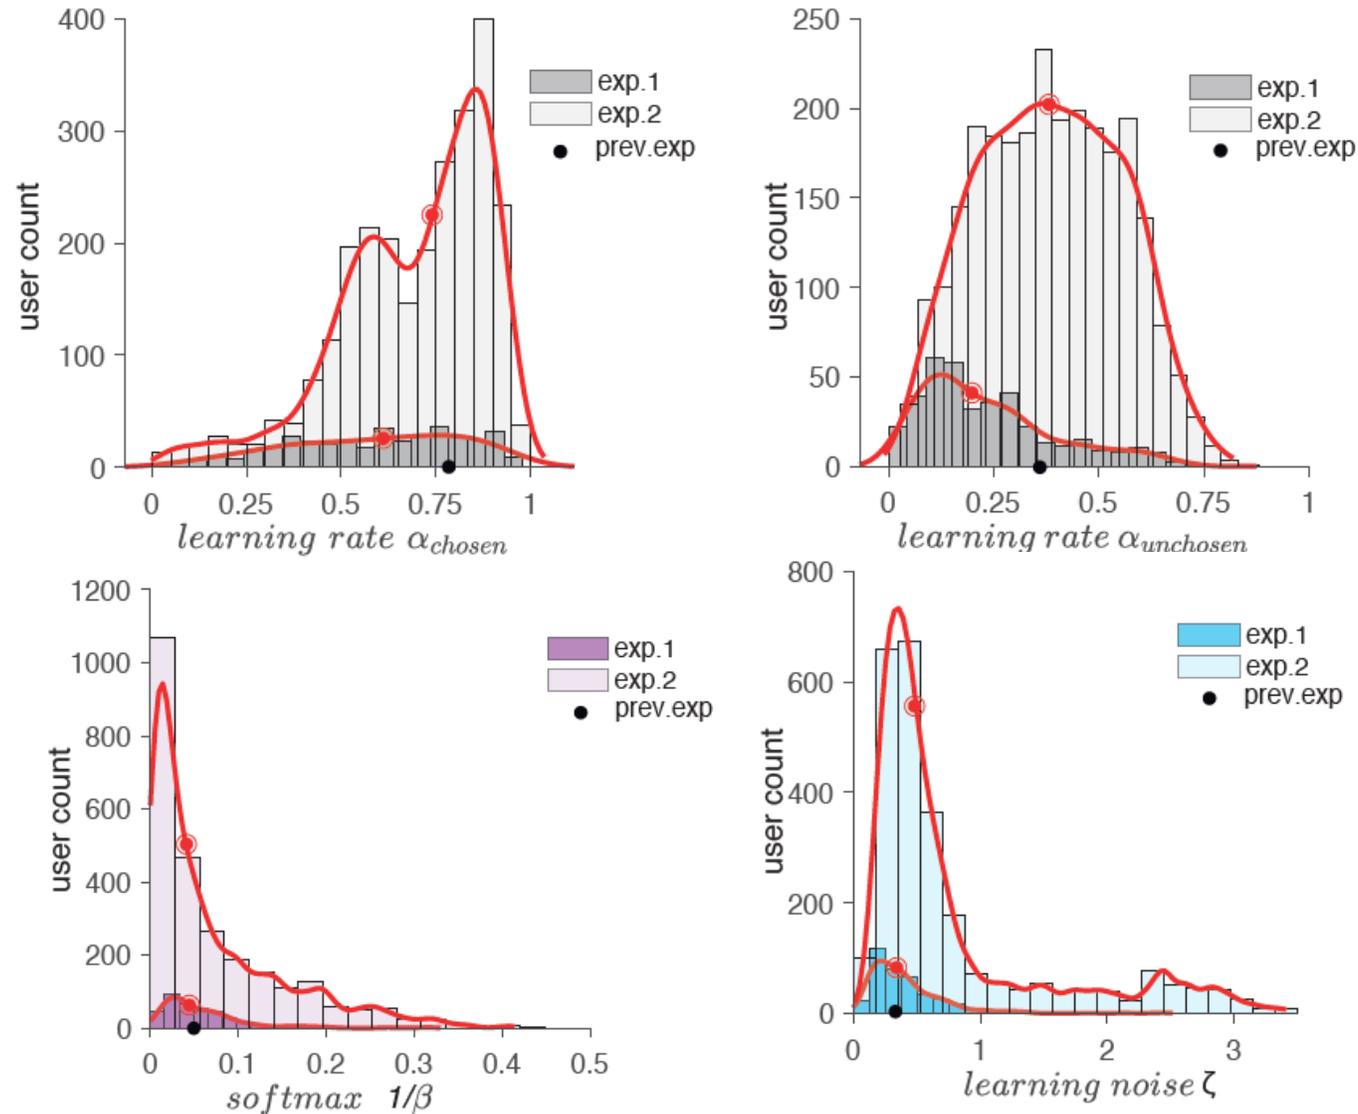

Smartphone sample: N=2610 (1499F)

- minimal instructions & no quiz
- 72 trials
- heavily animated
- medals and badges for performance

similar performance

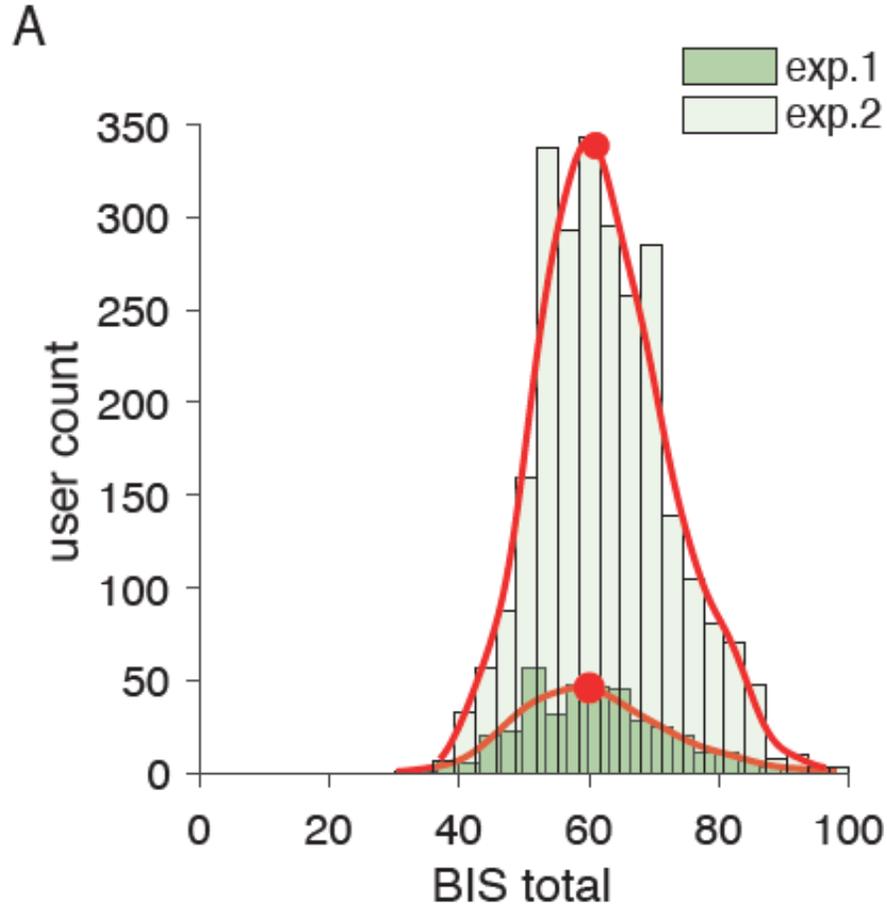

TASK PARAMETERS ACROSS PLATFORMS

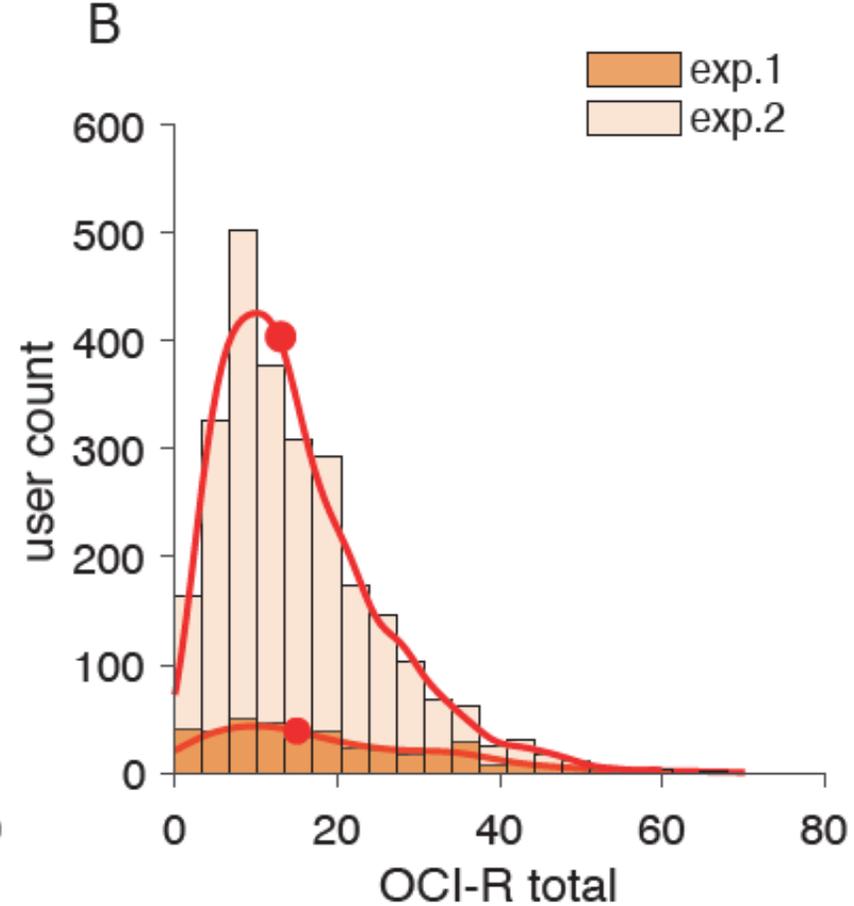

PSYCHIATRIC SYMPTOMS ACROSS PLATFORMS

impulsivity

compulsivity

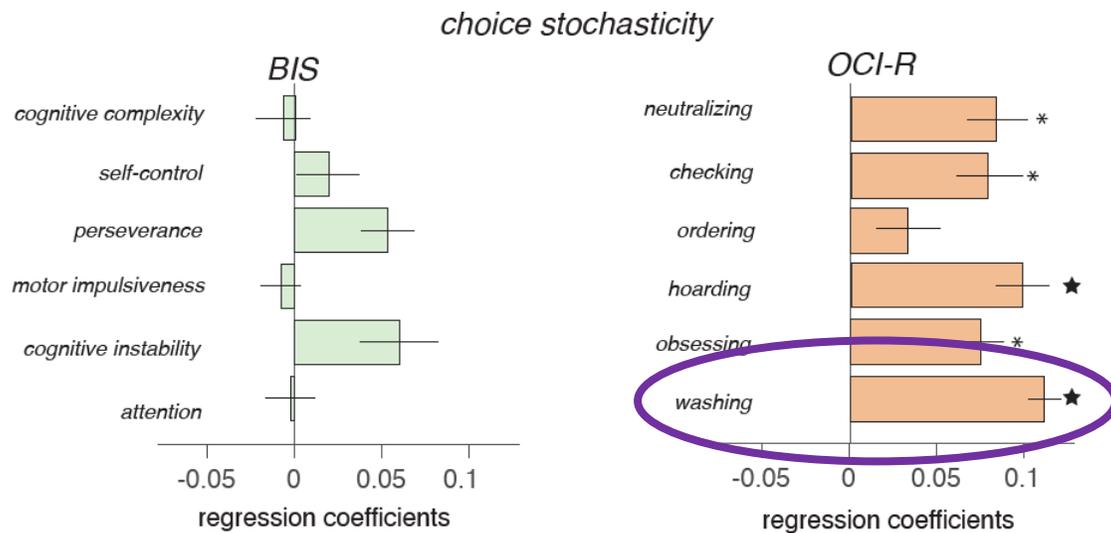

REPRODUCIBILITY MENTAL HEALTH LINKS

compulsivity & choice stochasticity

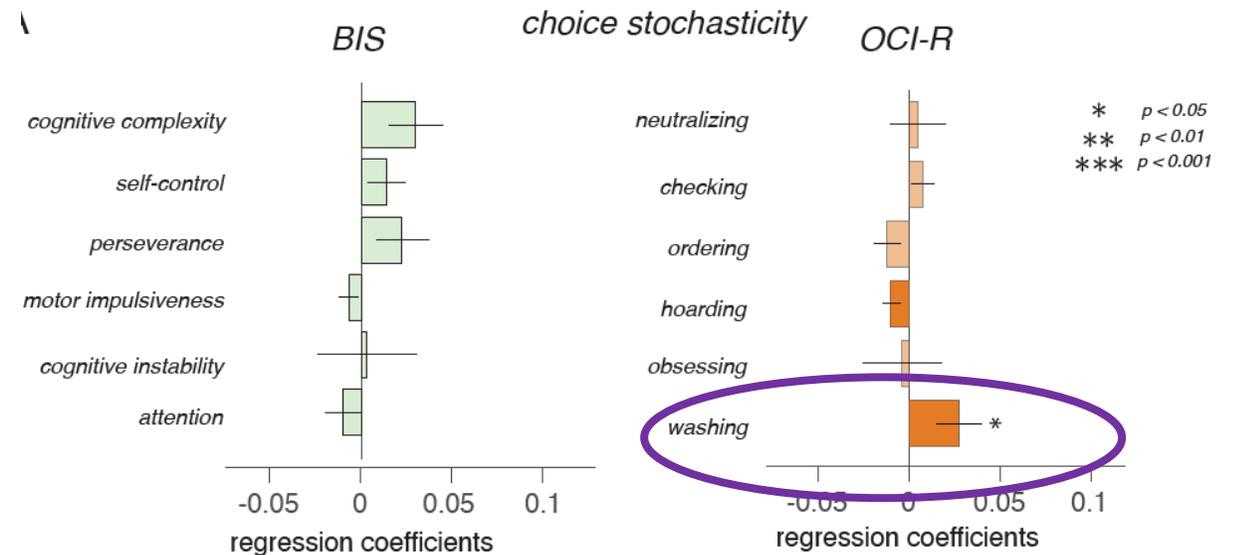

prolific sample

Brain Explorer sample

A

A

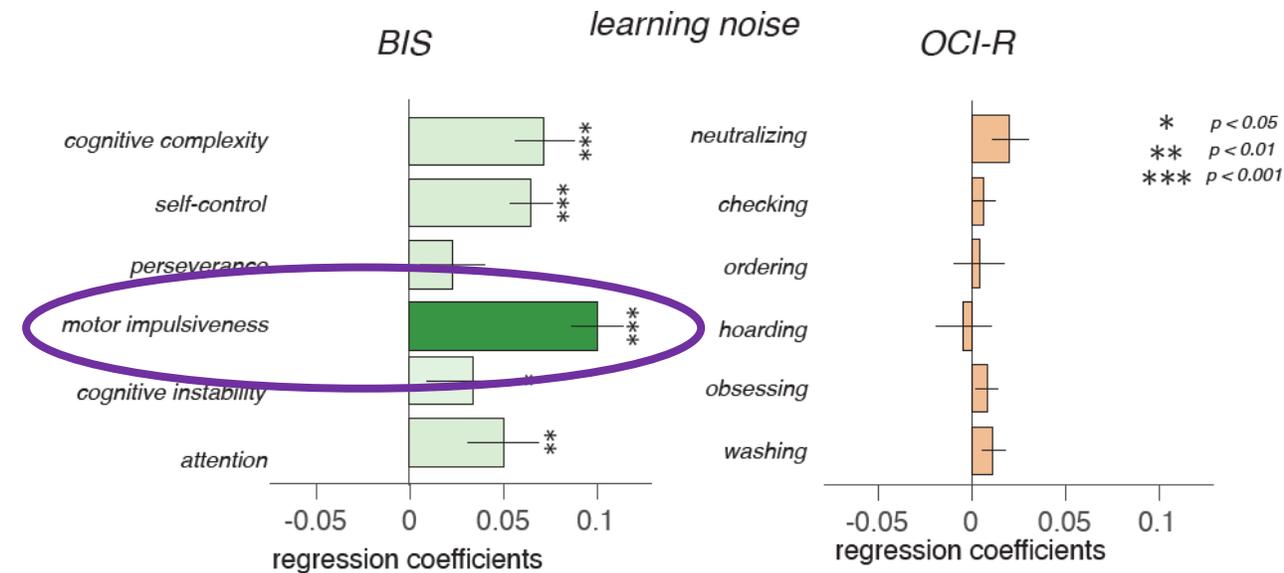

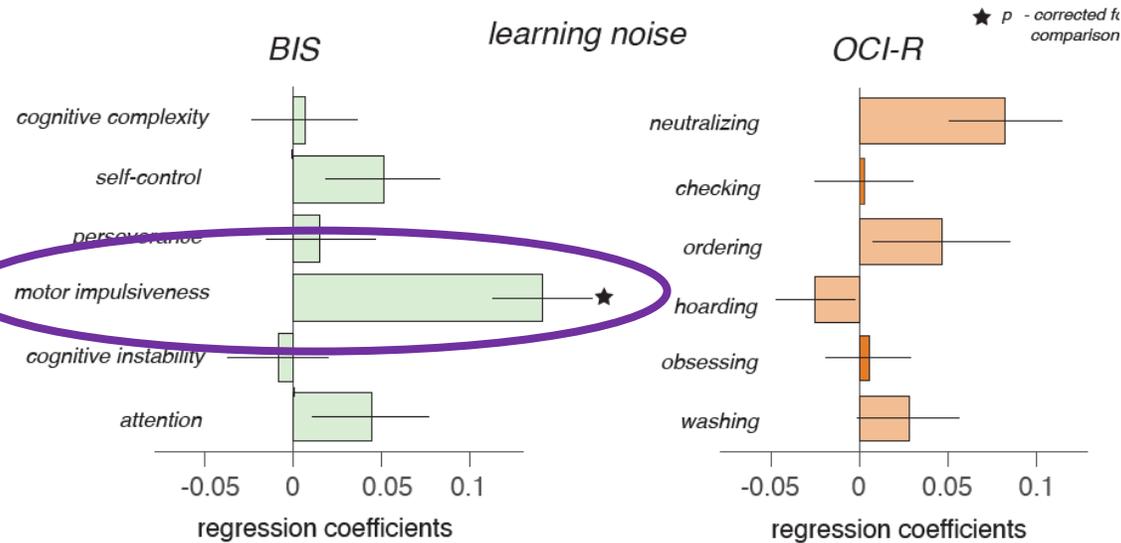

REPRODUCIBILITY MENTAL HEALTH LINKS

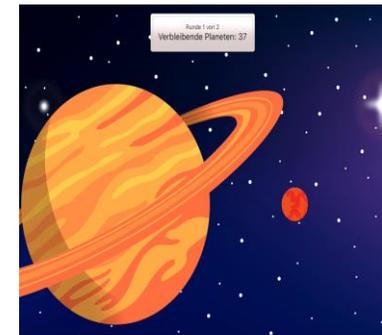

impulsivity & learning noise

prolific sample

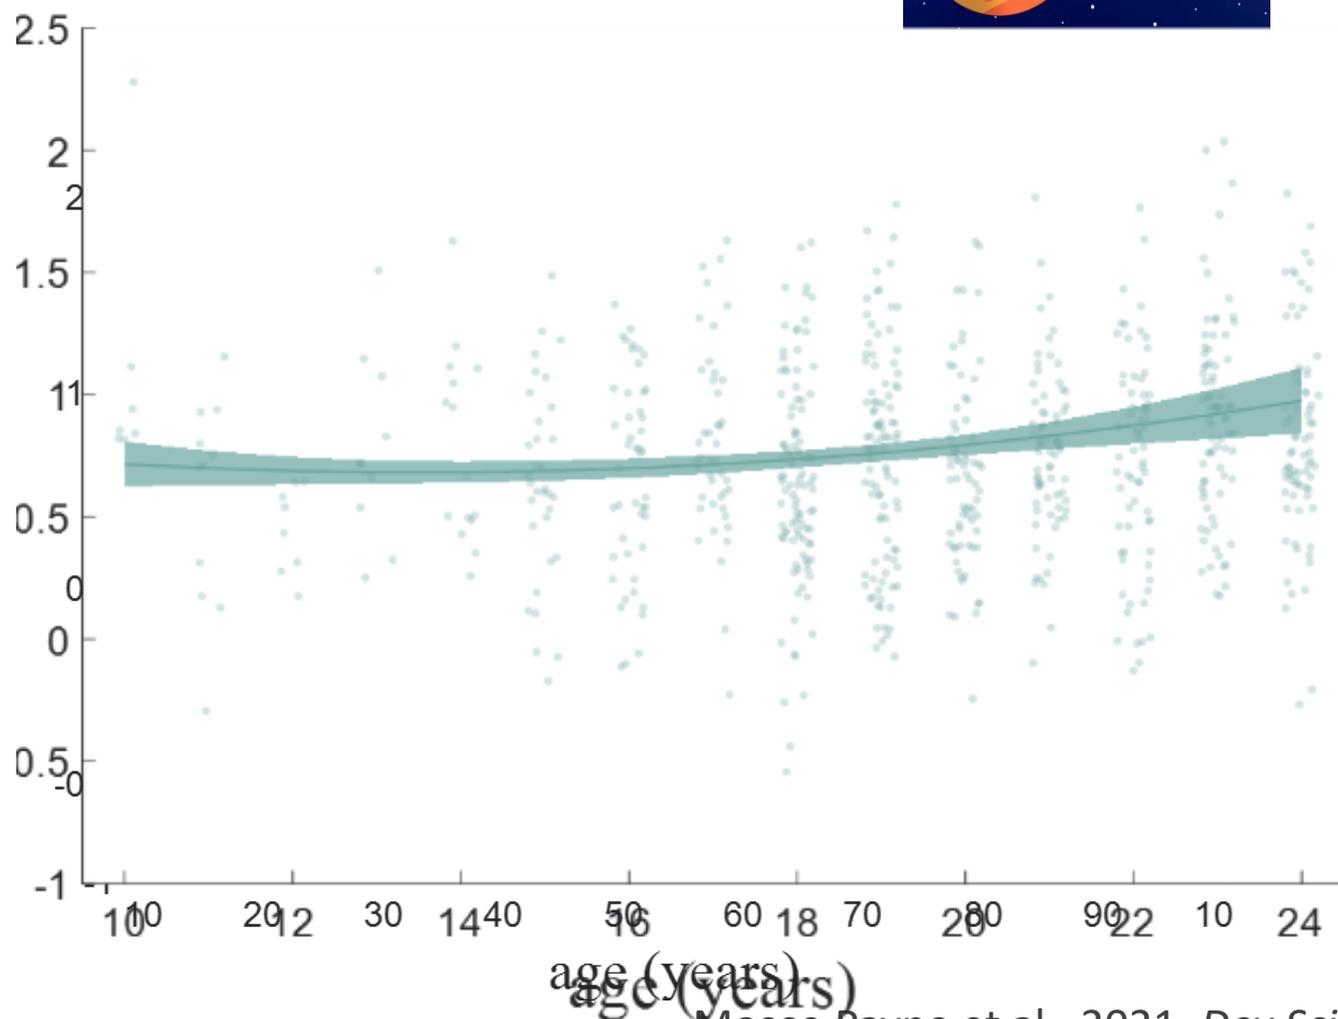

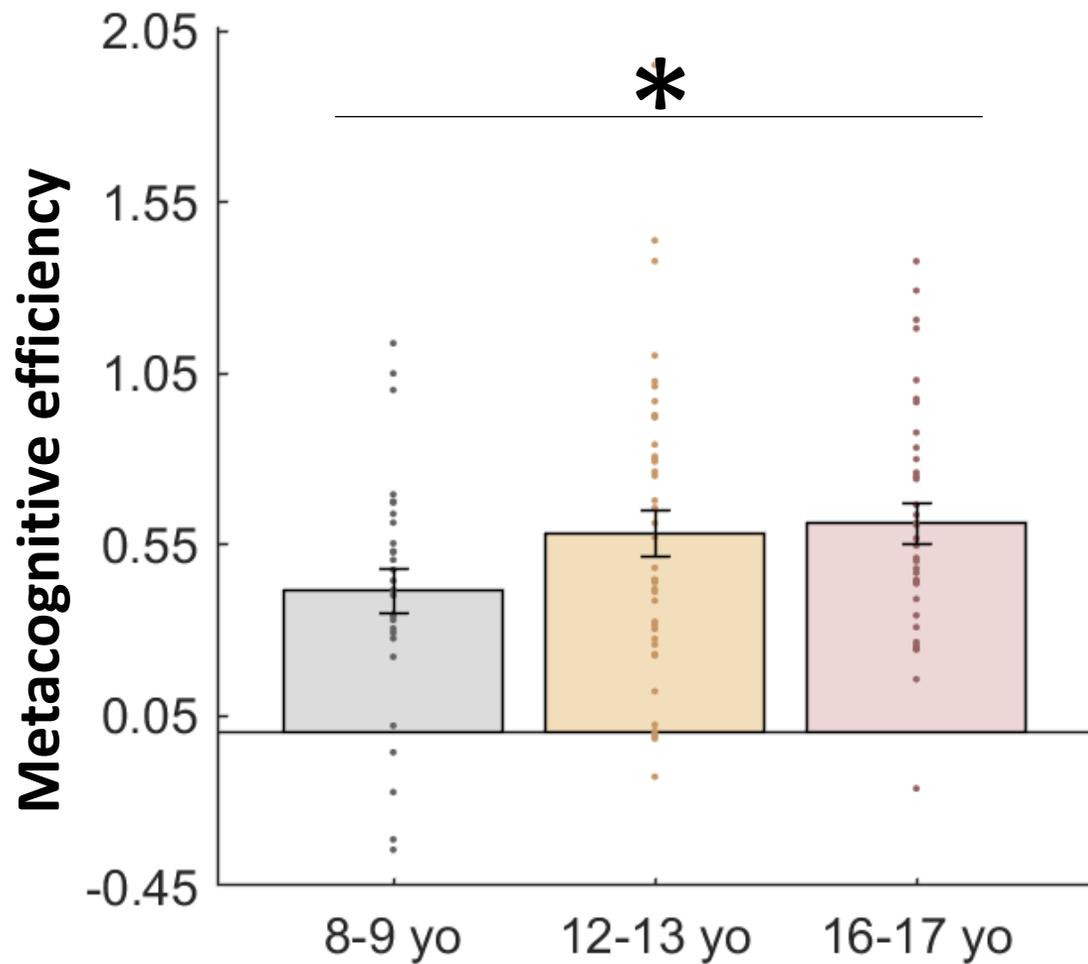

Brain Explorer sample

B

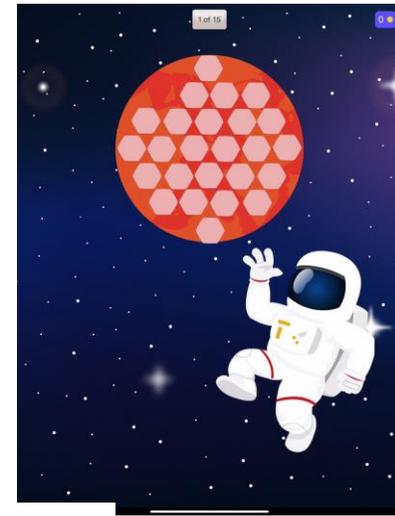

DEVELOPMENT ON PHONES

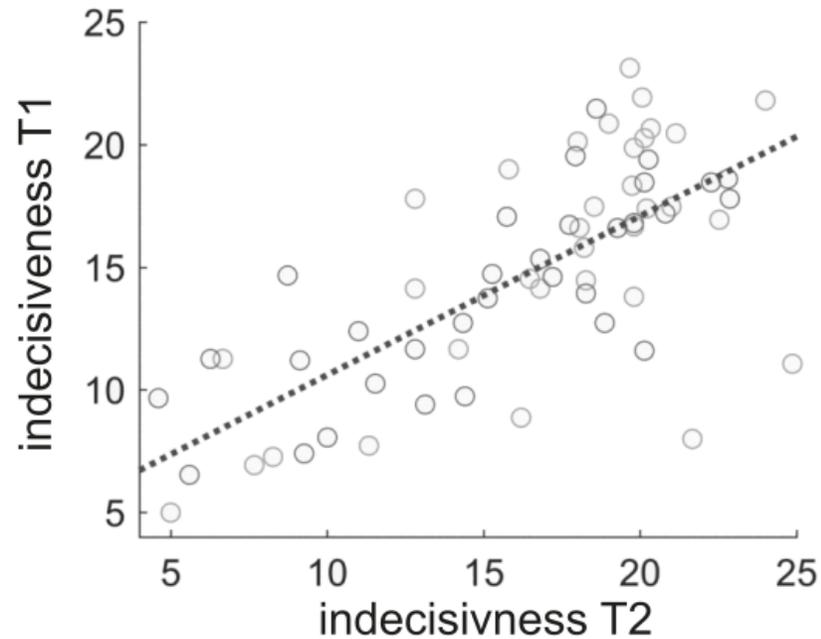

RELIABILITY ON PHONES

Information Sampling Task

laboratory

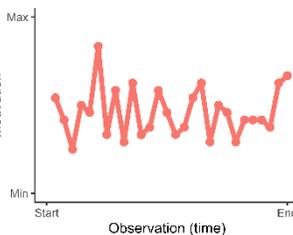

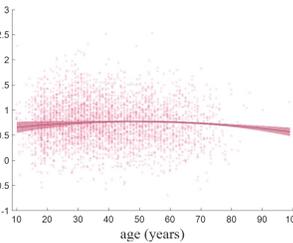

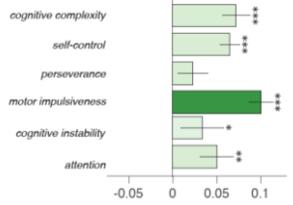

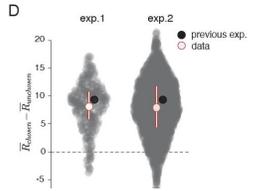

test-retest reliability: ICC=.55
Consistency: Cronbach α =.95

SUMMARY

- Similar behaviour in lab and on app
- Similar (but weaker) associations with mental health
- Similar developmental patterns
- Daily fluctuations capturing meaningful symptoms
